

2 SOLUTIONS FOR VACCINE STORAGE TEMPERATURE CONTROL

DESCRIPTION

You are receiving Covid-19 vaccines that you need to store in your refrigerators. Once the Pfizer/BioNTech vaccine is delivered to the vaccination point the storage time is 5 days at a temperature between +2 and +8°C. The Moderna vaccine should be stored at -20°C, the others between +2 and +8°C.

In order to comply with the HAS guidelines and to ensure the temperature control of the vaccines, we propose two solutions :

- A traceability system with a temperature data logger to be read periodically.
- An automated alarm and traceability system in real time.

SOLUTION 1 : TRACEABILITY SYSTEM

- 1 Temperature data logger Thermo Button :
-40/+85°C ±0.5°C
- 1 Thermotrack PC Solo software and reader
- Recommended option : calibration certificate

125€

Requires periodic reading on a PC

Thermo Button

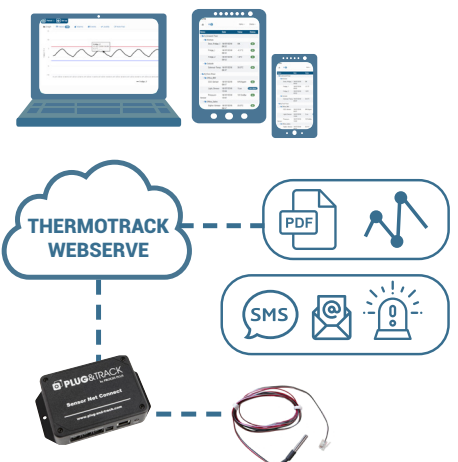

Software and Thermo Button reader

SOLUTION 2 : AUTOMATED ALARM AND TRACEABILITY SYSTEM

- 1 Digital temperature sensor :
- 40 à +85°C ±0.5°C
- 1 Sensor Net Connect Ethernet smart hub
- 1 Thermotrack Webservice Annual Alarm and Traceability System

200€

Automatic real-time readings

BOTH SOLUTIONS ARE COMPATIBLE WITH ALL VACCINES : PFIZER, MODERNA AND OTHERS

EQUIPMENT REQUIRED ACCORDING TO THE CDC :

“ Storage unit temperatures must be monitored regularly and checked and recorded at the beginning of each workday to determine if any excursions have occurred since the last temperature check. For accurate temperature monitoring, use a digital data logger (DDL)” ”
